FOREWORD

A SALUTE TO CROP, LIVESTOCK AND PRICE REPORTERS

The day-to-day, month-to-month, year-after-year and even generation-after-generation assistance given by the voluntary crop, livestock, price and other correspondents of the Departments of Agriculture in Colorado and throughout the wide United States is a fine example of democracy in action. The work of this large group of people might be referred to as good citizenship or the individual assumption of a segment of public responsibility. This voluntary and unpaid-for-service might also be described as a kind of "self-help" or "enlightened self-interest" since by this exchange of information they as individuals become personally well posted. Certainly these correspondents have reason to take pride in the crop and livestock reports, which portray the present and even look a bit into the future, for it is to a large extent their judgment regarding the condition of crops and livestock together with confidential information about their own operations which makes these published reports possible. This judgment and assistance received from many minds is the heart of the Agricultural Reporting Service.

Crop reporting was started in the United States nearly 100 years ago at the request of a group of farmers who recognized the need for unbiased information which would reveal the volume of crop production. Even in those early days, this group also recognized the necessity for assuming much of the responsibility for making crop information available to the U. S. Patent Office and later the Department of Agriculture in Washington. As the years passed and the need for additional information became evident, this program of fact gathering was expanded to include livestock and the many other branches of the agricultural industry such as the handling and processing of agricultural commodities. Expansion of the reporting program placed many additional responsibilities on farmers, ranchers and business organizations in making the information regarding their activity available to the Department of Agriculture agency designated to compile these facts. The assumption of these detailed, frequent and sometimes demanding responsibilities as a means of service to the agricultural industry is in itself a fine tribute to the public spirited attitude of these many citizens, then and now.

The field of crop and livestock production, buying, selling, transporting and processing of agricultural commodities touches a large portion of the economy of the State and Nation. For this reason it is difficult to enumerate all of those who deserve credit for service as correspondents. In this effort to make such an enumeration, however, we want first to name the farmers themselves who grow crops for sale or consumption on the farm, the raisers of cattle and sheep, and those who fatten these animals for market. We think also of the dairy farmer, the commercial vegetable farmer, the fruit grower and those who grow specialty crops such as seeds, etc. In each of these groups many individuals receive and execute questionnaires from the Agricultural Statistician's Office regularly and frequently each year.

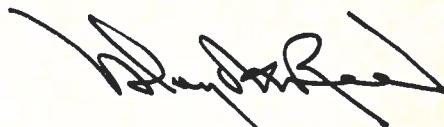

Those who buy, sell, store and transport the products of agriculture, such as managers of country elevators, operators of public auctions, commission firms, operators of packing sheds and others, render a valuable service by furnishing information regarding prices and quantities in storage. Processors, such as millers, meat packing and butchering establishments, sugar companies, fruit and vegetable canning firms, all furnish data for use in compiling and checking crop and livestock estimates. Railroads and trucking firms give assistance through reports on movement of livestock, staple agricultural commodities and perishables such as fruits and vegetables.

Merchants and dealers who sell commodities to farmers are also helpful correspondents. Their price reports are used to prepare the "parity index" which is essential in determining parity price levels. These correspondents are automobile, truck and farm machinery dealers and those who sell a large variety of supplies to farmers for use in production or the farm family living, such as building and fencing materials, gasoline, oil, feed, furniture, food, clothing, etc. They too return many questionnaires to the Agricultural Statistician's Office.

The groups mentioned and the discussion given above calls attention to the many phases of human endeavor touched by this fact-gathering activity. Some idea is also conveyed of the great effort put forth by these good citizens in making these facts available to themselves, to their industry and to the State and Nation. The faithfulness, promptness and willingness to furnish the requested information is appreciated. The confidence expressed in the fact-gathering agency is a significant factor in the success of the program. No confidence is ever violated.

The many facts which are given subsequently in this bulletin are the result of your many hours of effort. We just have the privilege of using statistical and analytical methods in putting them together so that they are meaningful and helpful.

Correspondents, we salute you!

FLOYD K. REED
Agricultural Statistician

REVIEW OF THE 1954 CROP SEASON

Combined production of principal field and fruit crops harvested in Colorado during 1954 was sharply below both 1953 and average. Contributing greatly to the low aggregate production of all crops was the smallest winter wheat output since 1944. The eastern plains section experienced the most severe crop and pasture shortages since 1934, but production in eastern irrigated sections and in a goodly portion of western Colorado made a fair to good showing. For three important cash crops—potatoes, dry beans and sugar beets—production was 10 to 25 percent below 1953 and was also below average. Production of feed grains totalled only 26.2 million bushels against 29.4 million bushels in 1953 and 37.8 million bushels the 10-year average. Harvest of oats, barley and corn for grain were the smallest since the short crops of the mid-1930's. Total hay production at approximately 2 million tons was $\frac{1}{2}$ million tons below 1953 and $\frac{1}{4}$ million tons below average. Above average fruit production in the lower western valleys provided the principal bright spot in the 1954 agricultural picture. In the west, apple production was the largest since 1949. The peach crop was the largest since 1945. However, fruit was near failure in eastern areas.

During 1954, farmers and ranchers in eastern Colorado were plagued with the most adverse weather conditions experienced in many years. At the outset of 1954, a major portion of that region was in the grip of drought conditions that continued from 1953. Dry soil and lack of vegetative cover in this area enabled high winds early in the spring to start soil erosion and create large scale dust storms. The combined effect of dry soil and wind action caused extensive abandonment of fall sown wheat, barley and rye. To further aggravate this situation, spring and early summer moisture was extremely short and temperatures were considerably above normal. This inhibited normal seeding operations and contributed to excessive abandonment of spring planted crops. In some areas, range and pasture grasses did not green all season and others developed little vegetative growth. Irrigated crops felt the pinch of the shortage of ditch water due to the below normal snow pack. This contributed to uneven stands and more than usual abandonment of irrigated crops, particularly in northern Colorado. Due to adverse weather during the growing season, about one-third of the total planted or established crop acreage, or one of each three acres was abandoned. During the 1934 drought year, abandonment reached 44 percent of this total. Abandonment during the past 10 years averaged about 15 percent.

Indications are that receipts from sale of farm products during 1954 totalled \$442 million. This compares with \$478 million in 1953 and \$603 million in 1952. The decline in cash receipts in 1954 is particularly significant when it is noted that a portion of the total resulted from sales of carryover 1953 production and cash realized from close selling and some liquidation of breeding stock.

Wheat—Production of 1954 crop winter wheat at 17,724,000 bushels was less than half the 1953 crop of 42,191,000 bushels and the 10-year (1943-52) average of 39,449,000 bushels. The 1954 winter wheat crop was the smallest since the 1944 output of 15,736,000 bushels. The extremely small 1954 crop stemmed from reduced plantings due to acreage allotments, abandonment of nearly one-half the seeded acreage, and a low average yield of only 10.5 bushels per harvested acre. The entire growing season was extremely unfavorable for the wheat crop and prospects deteriorated as the season progressed. As in the three preceding years, most of the 1954 winter wheat crop was harvested in the northeastern quarter of the state.

Spring wheat production at 858,000 bushels was the smallest in 46 years of record. The 1953 spring wheat crop totalled 1,684,000 bushels and the 1943-52 average production was 2,227,000 bushels. Both acreage planted and harvested were the smallest of record in 1954 totalling only 82,000 and 52,000 acres respectively. Percentage abandonment of acreage in 1954 was the highest since 1939 and was exceeded only by proportional losses in 1939 and 1934. The 1954 average yield at 16.5 bushels compared favorably with earlier years only because of irrigated production and favorable conditions in the limited non-irrigated areas of production.

Value of the 1954 wheat crop (winter plus spring) was estimated at \$39,832.00 compared with a valuation of \$89,371,000 placed on the 1953 crop. Value of the 1952 crop was estimated at \$119,159,000.

Potatoes—Potato production during 1954 at 10,620,000 sacks was 8 percent smaller than the 1953 crop of 11,481,000 sacks. Average production during the 10-year (1943-52) period was 10,756,000 sacks of 100 pounds.

The area harvested in 1954 was 54,000 acres compared with 57,000 acres harvested in 1953. The 1954 crop yield per harvested acre was 197 sacks against a 201 sack yield attained in 1953. Most of the 1954 acreage reduction occurred in northern Colorado as plantings in the San Luis Valley were nearly the same both years.

The crop had a poor start due to the spring drought and shortage of ditch water for irrigation. The influence of the latter was partially overcome during the growing season by heavier than usual application of pumped water, particularly in the San Luis Valley. The adverse effect of irregular stands on production was offset in part by more uniform sizing of tubers. Also, the open fall and late frosts prolonged the growing season, adding to the crop. Weather was ideal for harvest in the San Luis Valley and in northern Colorado, but frequent showers caused difficulties in the western valleys.

Prices received for 1954 crop potatoes were much improved over 1953. The 1954 price averaged \$2.05 per hundred compared with \$1.22 received for 1953 potatoes. Value of the 1954 crop was slightly over \$21 $\frac{1}{4}$ million, while the 1953 crop was valued at just over \$14 million.

Sugar Beets—The 1954 beet crop totalled 1,654,000 tons against 1,956,000 tons in 1953, and 1,864,000 tons the 10-year average. Plantings in 1954 at 151,400 acres were 25 percent larger than in 1953 but extensive abandonment and lower yields per harvested acre resulted in the smaller production. Abandonment percentage and actual acreage loss was the greatest since 1925. Yields were the lowest since 1948. Fall weather was favorable for late development and harvest in eastern areas. The estimated tonnage harvested in 1954 came from 115,100 acres with a yield of 14.4 tons. The 1953 crop was harvested from 115,500 acres with an average yield of 16.9 tons. Value of the 1954 sugar beet crop was \$17,532,000 compared with \$22,885,000 the previous year.

Dry Beans—The 1954 crop of dry beans totalled 2,074,000 bags (100 pounds field run). This production, nearly all pintos, was nearly 10 percent smaller than the 1953 crop of 2,307,000 bags, however, still 3 percent above the average production of 2,007,000 bags. The Colorado crop of 1,960,000 bags (clean basis) of pintos was approximately 43 percent of the U. S. total pinto bean production. In 1953, Colorado produced 2,192,000 bags of clean pinto beans or about 45 percent of the U. S. total.

The crop in northern Colorado was curtailed by the spring and summer drought and some acreage was planted the second time before satisfactory stands were obtained. The southwest non-irrigated crop looked promising early in the season but did not measure up to earlier expectations due to adverse weather during August and at harvest. An extended rainy period at harvest time caused considerable loss in fields of southwestern Colorado and in the Montrose-Olathe area due to beans shattering from pods.

During 1954, 244,000 acres of beans were harvested compared with 224,000 acres a year earlier. Nearly all of the acreage increase was on non-irrigated land. The yield per acre was 850 pounds in 1954 against the 1953 yield of 1,030 pounds. Yields on the non-irrigated crop averaged about 290 pounds while the average yield from irrigated land was 1,610 pounds during 1954. A year earlier, the non-irrigated land produced an average of 430 pounds per acre and irrigated land returned 1,750 pounds per harvested acre.

Prices received for 1954 crop beans were lower than in any of the preceding 3 years and averaged only \$6.50 per hundred pounds (clean basis). Lower prices coupled with curtailed production in 1954 resulted in an 18 percent decline in total value from 1953—\$12,740,000 in 1954 compared with \$15,563,000 in 1953.

Corn—Production of all corn in 1954 totalled 11,745,000 bushels, the smallest crop in 15 years. The 1954 crop was 8 percent smaller than the 1953 crop of 12,832,000 bushels and about 16 per cent below the average crop of 14,030,000 bushels. Production of corn for grain in 1954 amounted to 5,913,000 bushels compared with 7,110,000 bushels harvested the preceding year and 9,342,000 bushels the average. A larger than usual proportion of the corn acreage was harvested for silage in 1954. The total of 4,269,000 tons placed in silos in the fall of 1954 was 6 percent greater than the amount of corn utilized for this purpose in 1953. Acreage of corn cut for silage in 1954 was estimated to have

been 141,000 acres while in 1953 only 120,000 acres were cut. Yields, however, averaged 10.0 tons per acre in 1953 and only 9.0 tons in 1954. Corn acreage utilized for forage was about the same both years, 45,000 acres in 1954 and 44,000 acres in 1953.

Value of all corn for all purposes in 1954 was placed at \$18,557,000 compared with \$20,018,000 in 1953.

Barley—The 1954 season was extremely unfavorable for the production of barley. Much of the expanded acreage seeded in eastern Colorado on lands diverted from wheat was abandoned due to drought conditions. Production in 1954 amounted to 7,067,000 bushels against 9,288,000 in 1953 and 15,048,000 bushels the average. The 1954 crop was the smallest since 1935.

Oats—Production of oats for grain in 1954 totalled 3,276,000 bushels, only about two-thirds the 1953 bushelage of 5,008,000. Area harvested at 126,000 acres in 1954 was 21 percent smaller than in 1953 when 159,000 acres of oats were cut for grain. Acreage of oats grown on irrigated land declined 25 percent in 1954 from 1953 while non-irrigated acreage declined only 14 percent. Yields averaged 34.0 bushels on irrigated land and 15.5 bushels on non-irrigated land in 1954. In 1953, oats harvested from irrigated land returned 40.0 bushels per acre and non-irrigated land produced 18.5 bushels.

Despite an 8 cent increase in season average price, value of the 1954 oats crop was down one-fourth from the 1953 crop value due to the drastically curtailed production. In 1954, oats harvested for grain were valued at \$2,948,000; the value in 1953 was placed at \$4,107,000.

Sorghums—Production of sorghums for grain in 1954 was placed at 4,158,000 bushels. This was one of the largest crops ever harvested and compared with a 2,268,000 bushel harvest in 1953 and an average of 2,732,000 bushels. Growing conditions were extremely spotted but later than usual frosts permitted harvest of grain from some late planted sorghums. A larger than usual acreage of sorghums was harvested in northeastern Colorado. Sorghums harvested for forage totalled 275,000 tons compared with 347,000 tons in 1953 and 382,000 tons, the average.

Broomcorn—Another short broomcorn crop was produced in 1954. The total being 5,100 tons compared with 5,400 tons harvested in 1953 and an average production of 11,470 tons. With the exception of 1952, the 1954 broomcorn crop was the smallest since 1939.

The 1954 crop season in the principal producing areas was very erratic. Soil moisture conditions were unfavorable for planting and germination of the crop in Baca County during the normal planting season. This early planted broomcorn encountered adverse conditions from planting until mid-July when local rains relieved the situation. Much of the early planted acreage was abandoned because of thin stands and poor quality which resulted from the intermittent growth pattern. Plantings continued into late July. Rains at that time encouraged planting with the primary interest of many farmers being to establish cover on the land. An unusually late frost date in the fall of 1954 enabled more of this corn to reach maturity than was anticipated. Most of the tonnage produced came from the late planted crop.

An average price of \$330 per ton for the 1954 broomcorn crop resulted in a total crop value of \$1,683,000. For the 1953 crop, prices averaged \$300 per ton and the total crop value was estimated at \$1,620,000.

Seed Crops—Alfalfa seed production during 1954 was estimated at 3,105,000 pounds compared with 2,520,000 pounds in 1953 and 2,269,000 pounds the 10-year average. Alfalfa acreage cut for seed totalled 23,000 acres in 1954 compared with 21,000 acres in 1953. Yields per acre in 1954 averaged 15 pounds higher than the 1953 harvest and 39 pounds above average. Quality of the 1954 crop was good and prices were substantially higher than in 1953. Valuation of the 1954 crop was placed at \$904,000, 64 percent greater than the \$549,000 valuation of the 1953 crop.

Sweetclover seed production totalled only 600,000 pounds. This compares with a harvest of 1,480,000 pounds of seed in 1953 and an average of 2,324,000 pounds. Area harvested in 1954 at 4,000 acres was only half that harvested in 1953 and was the smallest acreage harvested since 1935. The curtailed acreage in 1954 coupled with a below average yield, only 150 pounds per acre, resulted

in the smallest sweetclover seed crop since 1934. Prices in 1954 were much better than in the preceding 3 years but total value of the crop reached only \$67,000. Value of the 1953 crop was \$126,000.

Production of sudangrass seed in 1954 amounted to 10,450,000 pounds, the second largest crop on record being exceeded only by the record 17,160,000 pound harvest of 1953. Area harvested in 1954 was 38,000 acres compared with 52,000 acres harvested the year before. The season average price received for the 1954 crop was \$8.50, almost double the \$4.70 received for the 1953 crop. As a result, the smaller 1954 crop produced a higher valuation than did the 1953 crop; \$888,000 in 1954 and \$807,000 in 1953.

Hay Crops—Spring and summer drouth over much of the state plus a short flow of irrigation water curtailed 1954 hay production. Production of all hay totalled 2,089,000 tons against 2,506,000 tons harvested in 1953 and 2,194,000 tons the 10-year average. Hay was cut from a total of 1,350,000 acres in 1954 compared with 1,456,000 in 1953 and 1,377,000 the average. Fairly heavy fall cuttings of alfalfa hay contributed much to the 1,548,000 ton harvest of this crop as spring and mid-summer cuttings were extremely light. Production was 1,827,000 tons in 1953. Acreage harvested in 1954 totalled 755,000 compared with 812,000 acres cut the year before. Wild hay harvested amounted to only 189,000 tons, compared with a 285,000 ton harvest in 1953. Area of wild hay cut in 1954 was 252,000 acres; in 1953, 300,000 acres were cut. A rather mild, open fall over much of the state tended to limit early season hay feeding requirements. Value of the 1954 hay crop was \$54,941,000. The 1953 crop was valued at \$52,375,000.

FRUIT CROPS

The 1954 commercial apple crop was 1,500,000 bushels compared with 840,000 bushels harvested in 1953 and the average of 1,346,000 bushels. September rains favored the late crop in the important western Colorado shipping area where nearly all the apples were produced in 1954. Conditions were favorable all season on the Western Slope but very few apples were produced in eastern Colorado. The Fremont County crop was almost a total loss due to freeze and the Larimer County crop was short because of freeze damage and water shortage. Harvest of late apple varieties was about 2 weeks earlier than usual in 1954. Value of the 1954 apple crop was placed at \$3,600,000. Peach production totalled 2,230,000 bushels in 1954 against 1,312,000 bushels harvested in 1953 and 1,817,000 bushels, the 10-year average. The 1954 crop season was extremely favorable for peaches in Mesa County and adjacent areas resulting in the second largest harvest on record. The 1954 harvest was one of the earliest on record with volume shipments beginning on August 17, the earliest date since 1943. Volume shipments of 50 or more cars a day normally do not begin until about August 25. Volume shipment ceased on August 28, 1954 but commercial movement (25 or more cars per day) continued until September 4. The marketing agreement in effect in 1954 set the minimum size for shipment at 2 inches in bushels and bulk with the maximum count for boxes set at 78. Minimum quality for shipment was U.S. No. 1. Value of the 1954 peach crop was estimated at \$5,644,000 compared with the 1953 crop value of \$3,714,000.

Pears produced in 1954 amounted to 270,000 bushels. This compared with 150,000 bushels harvested a year earlier and the average of 192,000 bushels. The 1954 crop was the largest since 1945 and was worth \$675,000. The 1955 crop was valued at \$390,000.

A record high sweet cherry crop of 1,200 tons was harvested in 1954. This compared with the record low production of 130 tons just one year earlier and an average production of 535 tons. Valuation of the 1954 crop was placed at \$324,000, more than 6 times the \$52,000 value of the 1953 crop.

Production of sour cherries in 1954 totalled 1,550 tons and was valued at \$279,000. Production in 1953 amounted to only 700 tons with a valuation of \$136,000. Sour cherry production continued the decline of recent years in eastern Colorado while production continues to increase in the western valleys.

COMMERCIAL VEGETABLES

(1954 Crop Season)

The characteristics and influencing factors pertaining to the 1954 season were given on pages eight and nine of the 1953-54 edition of Colorado Agricultural Statistics published in May 1955. In light of this a detailed discussion of

the 1954 commercial vegetable deal in this section would be mostly repetition. However, statistics covering acreage, production and value of individual crops grown that year are shown as comparable data in the Review of the 1955 Season found elsewhere in this text.

REVIEW OF THE 1955 CROP SEASON

(Preliminary Estimates)

Production of principal field and fruit crops in Colorado in 1955 aggregated about one-tenth more than that harvested in 1954 but was slightly below the 10-year (1944-53) average. Although gross production compared favorably with 1954, it was noteworthy that the tonnage of the principal "cash crops"—food grains, fruits, potatoes, dry beans and sugar beets—composed a smaller proportion of the total than usual. Winter wheat production at 16½ million bushels was moderately below 1954 and was only 40 percent of average. The output of feed grains, field seeds, hay and other rough feed increased over 1954 and compared favorably with the average. Rough feed other than hay for wintering livestock was much above average. Hay production of nearly 2.3 million tons was about average and exceeded 1954 production by about a quarter million tons. Production of feed grains totalled 34.5 million bushels. Production in 1954 was 26.2 million and the 10-year average 36.7 million bushels. Summer range and pasture feed was generally good to excellent in western Colorado but the carrying capacity was far below normal over most of the eastern plains. Indications are that receipts from sale of farm products during 1955 totalled only \$418 million, lowest since 1946. This compares with \$442 million in 1954, \$478 million in 1953, and the high of \$603 million in 1952. Contributing to the lower farm income was lower prices and the drought which caused extensive abandonment of acreage and resulted in smaller production of important "cash crops."

Acreage abandonment of principal crops planted in 1955 was placed at 36.0 percent compared with 31.5 percent in 1954 and 13.5 percent, the 10-year (1944-53) average. Although portions of the state experienced drought conditions as severe as in 1954, the 1955 drought in general was less extensive and of shorter duration. Winter wheat was the hardest hit with 3 out of each 5 seeded acres failing to reach harvest. Strong winds during the spring caused blowing of dry soils and delayed normal farming operations over much of the eastern plains country. Record sorghum plantings, in part as a "rescue" crop on abandoned wheat lands, matured much needed roughage feed and grains and abated some of the economic loss of income otherwise in store for many farmers and ranchers. The extreme east-central part of the state, particularly Kit Carson, Cheyenne and Kiowa Counties, was plagued by severe drought most of the summer and produced very little on the acres plaited. Supply of irrigation water was below normal with early season flow extremely short. This, associated with lack of rainfall during the spring planting season, resulted in considerable abandonment of cash crops, especially those grown on irrigated lands in northern Colorado. In general, crop production in western Colorado and the extreme northeastern corner of the state fared best as growing conditions were nearly normal.

Wheat—Production of winter wheat at 16,237,000 bushels was the smallest crop harvested since 1914. This compared with production of 17,724,000 bushels in 1954 and 40,730,000 bushels, the 10-year average. Widespread drought conditions and dust storms during the spring caused complete abandonment of nearly 2 million of the 3,184,000 acres seeded to wheat the preceding fall. As in other recent years, most of the 1955 crop was produced in the extreme northeastern corner of the state. A fair crop was harvested in Baca County. Spring wheat production totalled 1,020,000 bushels against 858,000 bushels in 1954 and the average of 2,172,000 bushels.

Potatoes—The 1955 potato crop was estimated at 9,603,000 sacks (100 lb.s) the smallest since 1951. This crop was 10 percent smaller than the 10,620,000 sacks harvested in 1954 from 56,000 acres planted and 54,000 acres harvested and was 12 percent under the average of 10,870,000 sacks. Although 57,000 acres were planted to potatoes in 1955 abandonment by natural causes plus a "plow-up" of additional crop acres in the San Luis Valley resulted in 4,000 acres not reaching harvest. The quality of potatoes in storage for the winter market was generally good to excellent. An early September frost stopped growth prematurely and resulted in an undue percentage of small-sized potatoes and fewer potatoes met minimum size requirements for shipment under the market-

ing agreement. More potatoes were diverted to starch from the crop in 1955 than 1954 and livestock feeding of potatoes was also in larger volume. The 1955 yield per acre was 181 sacks against 197 in 1954 and the average of 169. Production of late summer potatoes (usually marketed by October 1) totalled 2,079,000 sacks compared with 1,845,000 harvested in 1954. Production of fall potatoes (usually for market after October 1) totalled 7,524,000, over 1 $\frac{1}{4}$ million sacks short of comparable production in 1954 and nearly $\frac{3}{4}$ million sacks below the 5 year (1949-53) average.

Sugar Beets—Production of sugar beets, estimated at 1,628,000 tons, was only 2 percent under the 1,654,000 tons harvested in 1954 despite an 11 percent reduction in harvested acreage. The early growing season was generally unfavorable for the crop but an extended fall growing season with considerable sunshine added tonnage and improved sugar content. The weather was almost ideal for harvest. The 1955 tonnage was harvested from an estimated 102,400 acres with an average yield of 15.9 tons. In 1954, 115,100 acres were harvested with a relatively low yield of 14.4 tons per acre.

Dry Beans—The 1955 crop of dry beans was estimated at 1,989,000 bags (100 lb. field run). This production, mostly pintos, compared with 2,074,000 bags harvested in 1954 and the average crop of 1,978,000 bags. Production during 1955 was increased considerably over 1954 in southwestern Colorado but the irrigated crop was smaller than in 1954 in the important Northeastern producing area. Acreage harvested totalled 234,000 in 1955 against 244,000 acres a year earlier and 263,000 acres the average. Yield returns were 850 pounds per acre, the same as in 1954, but 79 pounds above the 10-year average.

In southwestern Colorado timely rains during the growing season and nearly ideal weather at harvest favored yield and quality of beans. In the large northeastern irrigated section and other eastern irrigated and non-irrigated areas the crop grew under less favorable conditions. Throughout much of northern Colorado conditions at planting time were extremely poor with thin stands and abandonment of acreage quite extensive. Some fields were replanted where earlier plantings failed to come up to a stand. A smaller proportion of the Colorado crop was on irrigated land in 1955 than in 1954. Yields on irrigated land averaged 1,500 pounds in 1955 against 1,610 pounds in 1954. The 1955 non-irrigated yield was 410 pounds compared with 290 pounds in 1954.

Corn—Production of all corn in 1955 was 16,650,000 bushels, about 5.0 million bushels larger than the 1954 crop and 2.8 million bushels above average. The 1955 output, the largest for the state since 1942, was harvested from 497,000 acres—approximately one-half the acres required to produce the 1942 crop. Increased use of hybrid varieties, increased fertilizer usage, and a larger proportion of the crop under irrigation contributed to the higher production. Production of 1955 grain corn at 7,192,000 bushels compared with 5,913,000 bushels produced in 1954. Corn cut for silage was a record 1,653,000 tons against 1,269,000 tons in 1954.

Oats and Barley—Production of oats in 1955 at 4,032,000 bushels was about $\frac{1}{4}$ above the very short 1954 crop of 3,276,000 bushels, but otherwise smaller than any other crop since 1940. Barley production totalled 8,875,000 bushels in 1955 considerably above the small 1954 crop of 7,067,000 bushels but far below the 14,215,000 bushel average. Abandonment of oats and barley acreage was extensive in eastern non-irrigated areas. Consequently, a larger proportion of these crops was grown in western mountain valleys and on irrigated land than the year before.

Sorghums—The second largest production on record of sorghums for grain was harvested in 1955 being exceeded only by the 5,298,000 bushel production in 1949. The 1955 harvest of 4,950,000 bushels compared favorably with the 1954 harvest of 4,158,000 bushels and the average sorghum grain production of 2,777,000 bushels. Late August and September weather was unfavorable for the crop throughout most of eastern Colorado and nearly one-third of the record large plantings of 1,808,000 acres failed to reach harvest. Sorghums harvested for forage totalled 405,000 tons against 275,000 tons in 1954.

Broomcorn—Production of broomcorn at 7,900 tons exceeded the short 1954 harvest of 5,100 tons due to higher yields per acre and a 13 percent increase in acreage harvested. A shortage of labor delayed harvest and resulted in some abandonment of matured acreage.

Seed Crops—Alfalfa seed was estimated at 3,375,000 pounds against 3,105,000 pounds in 1954 and the average of 2,211,000 pounds. **Sweetclover seed** at 1,100,000 pounds was nearly double the 1954 crop of 600,000 pounds but less than half the average crop of 2,378,000 pounds. **Sudangrass seed** totalled 14,400,000 pounds against 10,450,000 pounds in 1954. The 1955 crop was the second largest of record being exceeded only by the 17,160,000 pound crop of 1953.

Hay Crops—Production of all hay at 2,324,000 tons exceeded both the 2,089,000 tons harvested in 1954 and the average of 2,226,000 tons. **Alfalfa hay** production at 1,694,000 tons was 9 percent larger than in 1954 due to both larger acreage and higher yield per acre. **Wild hay** production at 209,000 tons in 1955 was slightly more than 10 percent greater than the 189,000 tons produced in 1954. Mid-November storms necessitated winter feeding of livestock about a month earlier than usual on the Western Slope. However, the hay supply was adequate for normal winter feeding requirements of livestock in most areas of the State.

FRUIT CROPS

The 1955 commercial **apple** crop was estimated at 1,210,000 bushels compared with 1,500,000 bushels harvested in 1954 and 1,316,000 bushels the average. Production in eastern areas was good versus the near failure of 1954. Movement of apples from the principal shipping areas of western Colorado was considerably below 1954 due to smaller production and low prices. The **peach** crop of 2,110,000 bushels was large again in 1955. The 1954 crop was 2,230,000 bushels and the 10-year average 1,751,000 bushels. Peak maturity of the crop occurred near the Labor Day weekend with the available number of fruit pickers insufficient for timely and complete harvest operations. The 1955 **pear** crop totalled 150,000 bushels against 270,000 bushels in 1954 and the average of 180,000 bushels. Production of **sour cherries** was 1,200 tons compared with 1,550 tons in 1954, and 2,750 tons the average. The **sweet cherry** crop at 580 tons was considerably smaller than the record large crop of 1,200 tons harvested in 1954 but was near the average of 508 tons.

COMMERCIAL VEGETABLES (1955 Season)

The 1955 season was marked by irregular and changing growing conditions generally and with greater variations between the principal vegetable districts than normally. However, early backwardness caused by lack of moisture, damaging winds and blowing soil was largely offset by more favorable conditions during the latter part of the season which resulted in most crops showing higher yields per acre than the year previous and average. In comparison with the average of recent years, the 1955 acreage was 17 percent below average but production was off only 9 percent. This high level of productivity is also obvious on the National scope as Colorado ranked 13th among the states in the area harvested for fresh market but moved up to 10th place in the aggregate tonnage produced. Processing crops made an even better showing with production ranking 21st and harvested acreage 28th. The Arkansas Valley lost 600 acres of onions and cantaloups by floods along the river together with smaller losses of other crops. The cantaloup deal was also curtailed sharply by excessive rains at harvest time. The San Luis Valley had more hail in 1955 than a year earlier but damage was not extensive. Crops in the Valley were very good, particularly cauliflower, lettuce and peas. There was also substantial expansion in carrots and spinach. Northern Colorado planted only a fraction of the acreage to lettuce of recent years and onion yields were not up to normal. The Western Slope experienced a more normal growing season than eastern districts but suffered extensive freeze damage to onions at harvest time.

A total of 40,000 acres of vegetables grown in Colorado for fresh market and for processing in 1955 yielded an aggregate production of 278,000 tons valued at \$15,225,000 compared with 38,000 acres, 265,000 tons and \$12,061,000 in 1954. The average of recent years was 48,000 acres, 306,000 tons and \$13,780,000.

Onions—In addition to holding top spot in the State's commercial vegetable industry, the 1955 dry onion crop of 3,074,000 sacks (50 pounds) amounted to more than 10 percent of the Nation's fall and winter onion supplies. Colorado ranked 5th among the states in the late summer group—less than five percentage points below second place Michigan. The December preliminary value of

the current crop was placed at \$4,150,000 but prices subsequent to January 1 failed to hold to the level anticipated at the time the preliminary estimate was made. In 1954, production of 2,950,000 sacks was evaluated at \$2,950,000, and the 1949-53 average was 3,816,000 sacks worth \$4,400,000. A total of 5,800 acres were harvested in 1955 compared with 5,900 in 1954 and 8,500 the 5-year average. The 1955 season was characterized by a slow start due to lack of moisture for germination and severe wind and drifting soil damage, which was followed, however, by favorable subsequent growing conditions resulting in above-average yields for the state as a whole. The Western Slope was the most favored district until the crop was severely damaged by freezes at harvest time.

Cabbage—As the second most important vegetable grown in Colorado, aggregate 1955 cabbage production accounted for almost 11 percent of the Country's summer and fall fresh market supplies. Colorado was the second largest producer in the important fall group of states. This year's 5,050 acres yielded 60,000 tons valued at \$1,631,000 against 4,950 acres, 59,100 tons and \$1,383,000 in 1954. The average of recent years was 4,690 acres, 60,300 tons and \$1,515,000.

Tomatoes—Tomatoes grown for fresh market and for processing were the third ranking vegetable in 1955 with a total production of 30,738 tons. Production for processing totaled 20,800 tons worth \$480,000 to growers compared with 24,100 tons and \$576,000 in 1954, while the crop grown for fresh market in 1955 amounted to 375,000 bushels valued at \$694,000 against 360,000 bushels and \$666,000 a year earlier.

Lettuce—Although ranking fourth in volume of production, lettuce moved up to second place in total value of vegetable crops as a result of the highest price per crate of record. The 1955 season was quite favorable for lettuce in the important San Luis Valley. The State had the smallest percentage of the acreage abandoned ever experienced and the highest average yield per acre of record. In addition to excellent quality, there was a strong demand for lettuce packed in the new vacuum-cooled cartons of two-dozen heads each. A total of 5,000 acres produced 750,000 crates with a farm value of \$2,438,000. In 1954, 5,000 acres yielded 600,000 crates worth \$1,320,000. The 5-year average was 5,160 acres, 631,000 crates and \$1,069,000.

Carrots—This crop is still going strong. "Prepackaging" in cellophane bags has further increased the acceptance of Colorado carrots in the market places. In 1955, 2,500 acres yielded 650,000 bushels against 2,400 acres and 558,000 bushels in 1954 and 1,520 acres and 386,000 bushels the 1949-53 average. The value of the current crop was also above last year and average.

Cantaloups—Efforts of growers to continue the gradual comeback of cantaloups of recent years were more than offset by lower yields in 1955 as a result of excessive rains when the melons were maturing. A total of 2,200 acres produced only 220,000 crates compared with 1,900 acres and 238,000 crates in 1954. Despite the smaller crop, the market was sluggish, reducing the crop valuation to \$330,000 against \$464,000 a year earlier.

Cauliflower—Although relatively small in volume, the 1955 cauliflower deal was the most profitable to growers of any recent year. A total of 1,000 acres produced 400,000 crates valued at \$600,000 compared with 800 acres, 300,000 crates and \$405,000 in 1954. The 1949-53 average was 2,140 acres, 649,000 crates and \$613,000.

Snap Beans—Production of snap beans for processing in 1955 totaled 5,200 tons with a farm value of \$419,000 while the fresh market crop amounted to 116,000 bushels bearing a cash value of \$244,000. In 1954, the canning crop of 6,000 tons brought \$548,000 to growers and the fresh market output of 116,000 bushels was worth \$307,000.

Other Vegetable Crops—Acreage and production respectively in 1955 compared with 1954 are as follows: **Celery**: 800 acres and 400,000 crates in 1955 against 900 acres and 450,000 crates in 1954. **Cucumbers for pickles**: 2,300 acres and 534,000 bushels compared with 2,300 acres and 485,000 bushels. **Sweet Corn** for fresh market: 3,600 acres and 396,000 5-doz. ears (of which 56,000 were not marketed for lack of demand) against 3,100 acres and 310,000 5-doz. ears. **Green Peas**: for fresh market, 2,200 acres and 198,000 bushels against 1,600 acres and 128,000 bushels; for processing, 800 acres and 800 tons (shelled) compared with 700 acres and 460 tons. **Spinach**: 900 acres and 180,000 bushels against 700 acres and 140,000 bushels.

¹ Data for 1954-55 are taken from the September 1955 issue "Survey of Current Business" published by U. S. Dept. of Commerce, under the heading "Personal Income by States and Regions." For detailed planation of these estimates, see text in September 1955 issue "Survey of Current Business," pp. 12-22.

² Compiled from Minerals Yearbook of the U. S. Bureau of Mines for the years concerned. Reported values were rounded to the nearest thousand dollars for ease of presentation and comparability with other come data.

³ In addition to minerals shown separately this total includes primarily molybdenum, vanadium, tungsten, natural gas together with sand and gravel and a number of other minerals of lesser importance. Individual ton on some minerals are not included for security reasons.

NOTE.—For a discussion of the significance of this table, see page 4 of Colorado Agricultural Statistics, 50.

¹Harvested acreage of oats includes acreage cut ripe and fed unthreshed prior to 1949. Beginning in 1949 estimates include only acreage threshed or combined.

²Planted for harvest in year shown. Winter wheat sown fall of preceding year.

³Only harvested acreage estimates are made for these crops.

¹ Revised 1949-54.² Unrevised 1949-54.³ Includes Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, Connecticut, New York, Pennsylvania, West Virginia, Ohio, Indiana, Illinois, Michigan, Wisconsin, Minnesota, Iowa, North Dakota, South Dakota, Nebraska, Montana, Idaho, Wyoming, COLORADO, New Mexico, Utah, Nevada, Washington, Oregon, and California. (Late summer and fall crops estimated separately for Michigan, Wisconsin, Minnesota, and California.) Prior to 1951, Arizona was carried in the Intermediate States group. For purposes of this table, acreage and production totals for Arizona in the years 1939-50 have been led into the Early States group to make data comparable.⁴ Includes North Carolina, South Carolina, Georgia, Florida, Tennessee, Alabama, Mississippi, Arkansas, Louisiana, Oklahoma, Texas, Arizona, and California; (Early and late crops estimated separately for California; combined for all other states.) Prior to 1951, Arizona was carried in the Intermediate States group. For purposes of this table, acreage and production totals for Arizona in the years 1939-50 have been led into the Early States group to make data comparable.

LIVESTOCK INVENTORY AND VALUE JANUARY 1, 1956 AND 1955

The farm and ranch livestock inventory on January 1, 1956 based on reports from stockmen throughout the State, indicated slightly more cattle and hogs on hand but fewer total sheep, work animals and chickens than the year previous. The number of stock sheep in breeding flocks equaled that of January 1, 1955 but fewer sheep and lambs in feed lots resulted in a decline in the total sheep inventory. Beef cows retained in breeding herds were increased 2 percent over the number retained one year earlier, but milk cow numbers declined 2 percent. Sows and gilts on farms were equal in number to holdings on January 1, 1955, and breeding ewe numbers were only slightly different from the previous year. Feed and roughage supplies for wintering livestock were slightly more plentiful than on January 1, 1955. In some sections of the State, locally grown feed was in short supply again in the winter of 1955 particularly in the east-central counties near the Kansas border. Values per head on January 1, 1956 for cattle, sheep and hogs were lower than for the same date the previous year, while values for work animals and chickens were higher. The aggregate value of all species of livestock and poultry combined, placed at \$208,585,000 on January 1, 1956 was about 5 percent less than the gross inventory value of \$219,272,000 for January 1, 1955. The January inventory worth of livestock and poultry on Colorado ranches and farms during the 10-year period (1945-54) averaged \$274,339,000.

Cattle and Calves—The number of all cattle and calves (including animals in feed lots) on ranches and farms January 1, 1956 was estimated at 2,075,000 head, up 1 percent from the 2,054,000 head on hand a year earlier. The inventory at the beginning of 1956, however, was 4 percent smaller than the record high holdings of 2,161,000 head reached on January 1, 1953, but was 9 percent larger than the 1945-54 average of 1,908,000 head. Beef cows in breeding herds January 1, 1956 at 770,000 head exceeded by 18,000 the number carried over a year earlier. However, fewer yearling beef heifers were in breeding herds than the previous year—232,000 in 1956 compared with 236,000 in 1955. Stockmen in some areas of the State were plagued with drought conditions again in 1955, but for the State as a whole, feed and roughage production in 1955 was slightly improved over that realized in 1954. This was considered a contributing factor

to the slightly larger cattle inventory on January 1, 1956. Average value per head of all cattle and calves at \$84.00 on January 1, 1956 was \$4.00 below January 1, 1955 and the lowest since 1946. Value per head reached a high of \$177.00 in 1952, dropped to \$117.00 in 1953 and declined to \$88.00 in 1954 and 1955. The 10-year (1945-54) average value per head was \$115.00. Total value of the cattle inventory of January 1, 1956 was \$174,300,000 compared with \$180,752,000 on January 1, 1955 and the average of \$220,841,000.

Cattle and calves in Colorado feedlots numbered 235,000 head on January 1, 1956. This was 40,000 head or 15 percent less than the 275,000 head on feed at the beginning of 1955. Feeding operations on January 1, 1956 were at the lowest level for the date since 1950. During the 10-year (1945-54) period, cattle on feed January 1 averaged 216,000 head. Colorado cattle feeders placed fewer animals in the feedlot, primarily because of insufficient margin between the cost of feeder stock and fat cattle prices. The reduction in numbers came in spite of more plentiful supplies of feed grains and roughage in the important feeding areas.

On January 1, 1956 about 40 percent of the cattle in Colorado feedlots had been on feed more than 3 months compared with 29 percent of the cattle being on feed more than 3 months on January 1, 1955. Thus, the 40,000 head reduction in total numbers resulted from fewer placements in feedlots in October, November, and December than were placed during the comparable 3-month period of 1954.

Northern Colorado and the South Platte Valley had the bulk of the decrease in numbers of cattle on feed, 198,000 head on January 1, 1956, compared to 238,000 for January 1, 1955. In the Arkansas Valley there were 29,000 head on feed January 1, 1956 against 30,000 for the previous year. Other sections of the state, including the lower western valleys showed a slight increase, 8,000 on January 1, 1956 as compared to 7,000 for January 1, 1955.

Of the total on feed January 1, 1956, 48 percent were steers, compared with 41 percent for the previous year. There was a significant decline in calves under 600 pounds. The number of animals in this light weight group (under 600) January 1, 1956 totalled only 12,000 head against 38,000 a year earlier. Cattle on feed at weights from 900 to 1,100 pounds totalled 70,000 head January 1, 1956, 37,000 less than on January 1, 1955. There were more cattle at weights exceeding 1,100 pounds and between 600 and 900 pounds on January 1, 1956 than on January 1, 1955.

A total of 165,000 cows and heifers, two years old and older were being kept for milk on Colorado farms and ranches on January 1, 1956. This was 3,000 head fewer than on January 1, 1955 and 36,000 head or 18 percent below the 10-year average of 201,000 head. Milk production per cow, however, has increased in recent years to partially offset the decline in milk cow numbers. Heifers being kept for milk cows totalled 45,000 on January 1, 1956, an increase of 5 percent from the 43,000 on January 1, 1955. Total milk stock (including heifer calves) totalled 263,000 head on January 1, 1956. The corresponding total one year earlier was 266,000 head. The average farm value of cows kept for milk on January 1, 1956 was \$138.00 a decrease of only \$2.00 from that of January 1, 1955. However, this \$138.00 was the lowest inventory value since 1947.

Calf Crop—The 1955 calf crop of 846,000 head represented a 3 percent decrease from the record calf crop of 873,000 in 1954 and ended 6 years of successive increases. The smaller number of calves came about from a decrease of 6 percent in number of cows kept for breeding, 920,000 on January 1, 1955

against 981,000 on January 1, 1954. On January 1, 1956 there were 935,000 cows of breeding age on farms.

Sheep and Lambs—The decline of the preceding two years in stock sheep numbers on farms and ranches was halted during 1955. On January 1, 1956, the stock sheep inventory at 1,241,000 head was unchanged from January 1, 1955. The inventory at the beginning of 1956 was smaller by 4 percent than the 1,293,000 head on hand January 1, 1954 and 6 percent below the 1945-54 average of 1,319,000 head. Ewes over 1 year old numbered 1,060,000 head on January 1, 1956, only slightly different from the 1,063,000 head on hand one year earlier. The inventory of ewe lambs at the beginning of 1956 showed an increase of 5 percent over 1955, totalling 137,000 head in 1956 against 131,000 one year earlier.

A valuation of \$14.50 per head was placed on the stock sheep inventory of January 1, 1956. This was a decrease of \$1.70 or 10 percent from the value one year earlier of \$16.20 per head and was 26 percent under the 1945-54 average of \$19.57. Total value of the inventory on January 1, 1956 was \$17,994,000 compared with \$20,104,000 on January 1, 1955.

Sheep and lambs in feed lots totalled only 490,000 head on January 1, 1956, a decline of 10 percent from the 542,000 on feed January 1, 1955. The number being fattened for market on the first day of 1956 was the smallest for the date since 1951 when only 435,000 head were on feed. The number of sheep and lambs being fattened in northern Colorado on January 1, 1956 totalled 335,000 head, compared with 397,000 on the same date in 1955. The number on feed in the Fort Collins area in 1956 was about the same as in 1955, but there was a sharp reduction in the Greeley area. The time of in-movement in northern Colorado was about normal. More lambs were on feed in the Arkansas Valley in 1956, the number being 125,000 compared with 95,000 January 1, 1955. Fewer lambs were on feed in the lower western valleys.

As was the case in the fall of 1954, the 1955 fall season was relatively mild and dry. This permitted full use of beet tops and other field crop residue. Good gains were made and death losses, in general, were light. The number on feed January 1, 1956 was the second smallest on record and compared with between a million and two million head on feed at the first of the year during the twenties and thirties. However, Colorado with nearly $\frac{1}{2}$ million head on feed January 1, 1956 was again the leading sheep and lamb feeding state followed by Nebraska with 435,000 head and Iowa with 353,000 head on feed.

Lamb Crop—A total of 1,031,000 lambs were docked or branded during 1955, a decrease of 2 percent or 23,000 lambs from the year before. The average number of lambs saved during the period 1944-53 was 1,050,000 head. A further reduction in size of breeding herds held by ranchers and farmers in 1955 was wholly responsible for the smaller lamb crop since the lambing percentage was unusually high and death losses were light. Breeding ewes on hand January 1, 1955 numbered 1,063,000 head, 3 percent fewer than a year earlier.

The 1955 lambing percentage of 97 lambs saved per 100 ewes was equalled only once before in the history of the Colorado sheep industry. Survival in 1954 was 96 lambs per 100 ewes, in 1951, 97 lambs per 100 ewes. The average was 92 lambs per 100 ewes during the 10-year period (1944-53). The number of early lambs (lambs dropped before March 15) was slightly greater in 1955 than in 1954.

Grazing conditions were very poor over much of eastern Colorado in 1955. However, on the Western Slope and in the mountain country where most of the Colorado stock sheep are located, range conditions were generally favorable after a late start. Some ranges had become dry until revived by rains in August, but sheep and lambs did well.

Wool—Wool production in 1955 totalled 11,518,000 pounds, 3 percent less than the 1954 clip of 11,879,000 pounds. Wool production during the 10-year

(1944-53) period averaged 11,603,000 pounds. The second heaviest average fleece weight ever attained partially offset the influence of a decline in the number of sheep shorn in 1955. Value of the 1955 wool clip excluding incentive payments was placed at \$5,068,000. Value of sales was \$5,940,000 for the 1954 wool crop and averaged \$6,049,000 during the 10-year period, (1944-53).

Weight per fleece in 1955 was 9.5 pounds compared with 9.3 pounds per fleece in 1954 and an average of 8.9 pounds. The number of sheep and lambs shorn in 1955 totalled 1,217,000 head. This was 66,000 fewer than were shorn in 1954 and 88,000 head less than the average number shorn. During the 10-month period, April 1955 through January 1956, Colorado woolgrowers received an average price of 44 cents per pound for shorn wool. Most of the 1955 wool clip was sold during this period. Final determination of the 1955-56 marketing season average price and Government incentive payments to be made direct to sheepmen after the close of the marketing season will not be made until after this bulletin goes to press. The season average price (April-March) for the 1954 wool clip was 50 cents and for the 10-year period (1944-53) wool averaged 52.4 cents per pound.

Hogs and Pigs—Hog inventory numbers rose to 195,000 head on January 1, 1956, an increase of 8 percent over the 181,000 head on January 1, 1955, but only 68 percent of the 1945-54 average number of 288,000. The major portion of the increase was recorded in pigs under six months. Pigs in this category numbered 115,000 on January 1, 1956 compared to 103,000 on January 1, 1955.

The average inventory value per head of all hogs and pigs was sharply lower on January 1, 1956 at \$15.50 compared to the \$26.00 of a year earlier. Lower prices more than offset the increase in hog numbers and the total inventory value at the beginning of 1956 was estimated at \$3,022,000, 36 percent less than the \$4,706,000 of January 1, 1955 and 63 percent below the 1945-54 average of \$8,265,000.

Hog producers during 1955 saved a total of 268,000 pigs, a 4 percent increase over the 257,000 pigs saved in 1954, but one-third below the 10 year (1944-53) average of 397,000 pigs. Production in 1955 was slightly more than one-fourth larger than the record low of 209,000 head produced in 1953 but far short of the record high of nearly a million pigs saved in 1943.

The 1955 spring pig crop totalled 154,000 head, 8 percent greater than the spring 1954 crop of 143,000 pigs saved. Although on an upward trend for two years, the 1955 spring pig crop remained 33 percent below the 1944-53 average number of 231,000 pigs saved. From 1939 through 1951, the spring pig crop held well over the 200,000 head level with the high point reached in 1943 when 560,000 spring pigs were saved.

The number of sows farrowed in the spring of 1955 totalled 23,000 compared with 22,000 one year earlier and an average of 38,000. Farrowings during January and February of 1955 were substantially higher than during the same period of 1954. Late spring farrowings, however, were smaller in 1955 compared with 1954. The estimate of 6.7 pigs per litter in 1955 marked a new record high for spring farrowings. The previous record high of 6.5 pigs per litter was recorded in the spring of 1954 with the 10-year average being 6.0 pigs per litter.

The fall pig crop of 1955 totalled 114,000 head, the same as a year earlier but 31 percent under the average of 166,000 head. Colorado hog producers farrowed 17,000 sows in the fall of 1955 with an average of 6.7 pigs saved per litter. The distribution of farrowings during the six month period (June 1 to

December 1) followed the pattern of several years preceding 1955 with nearly half of the pigs born in August and September. The hog price break in the fall of 1955 came too late in the season to materially alter fall farrowings.

Horses and Mules—There were 72,000 horses and mules on farms and ranches January 1, 1956, a drop of 3,000 from the January 1, 1955 total of 75,000 head. More than half of these were saddle horses and cow ponies. The rapid downward trend in workstock population is indicated by the following January 1 inventory numbers: 125,000 head in 1950, 235,000 head in 1940, 368,000 head in 1930.

Chickens and Eggs—The number of chickens on farms January 1, 1956 totalled 2,102,000 birds compared with 2,210,000 on January 1, 1955 and 3,164,000 the average. Value of the January 1, 1956 inventory at \$2,207,000 was approximately the same as that of January 1, 1955 which totalled 2,210,000. A total of only 2,998,000 chickens were raised on Colorado farms and ranches in 1955, a 20 percent decrease from the 3,747,000 raised in 1954.

Home consumption of farm flock chickens during 1955 totalled 1,083,000 birds, a 10 percent decline from the 1,203,000 birds consumed during 1954. Value of chickens for home consumption was placed at \$621,000 for 1955 compared with \$723,000 for 1954. Colorado farmers sold 1,581,000 chickens from their flocks for \$1,005,000 during 1955. In 1954 2,156,000 birds were sold for a cash return of \$1,440,000. Gross income from chickens sold from farm flocks in 1955 was estimated at \$1,626,000 compared with a gross income of \$2,163,000 in 1954.

During 1955, the number of eggs per layer equalled the record high of 185 established in 1954. In 1953, layers averaged 179 eggs during the year. The average number of layers during 1955 was 1,820,000, a decrease of 3 percent from the 1,879,000 in 1954. Annual production of eggs totalled 336,000,000 in 1955 compared to 347,000,000 in 1954. Cash receipts from sales of eggs increased in 1955 over 1954, however, as the result of a 2 cent increase in price per dozen. Cash receipts totalled \$9,032,000 in 1955 and \$8,863,000 in 1954.

Numbers of commercial broilers produced in Colorado declined for the second consecutive year during 1955 and totalled only 1,945,000 birds. This compared with 2,210,000 one year earlier and marked the first time since 1950 that the number fell below the 2,000,000 level. Price per pound for broilers was the lowest in 11 years of record during 1955 averaging only 29 cents. In 1954

prices averaged 29.7 cents. The record high price of 40 cents per pound was recorded in 1948. Gross income from broilers totalled \$1,749,000 in 1955 compared with \$1,903,000 in 1954 and \$1,982,000 in 1953.

Turkeys—The number of turkeys raised during 1955 was estimated at 860,000 birds a 4 percent decrease from the 897,000 raised in 1954 which was the largest number since 1946. The average price received for turkeys in 1955 was 28.7 cents per pound live weight compared with an average price of 28.8 cents per lb. in 1954 and 35.3 cents per lb. in 1953.

The lower price combined with lower numbers resulted in a decrease of 5 percent in cash receipts, \$4,783,000 in 1955 compared with \$5,055,000 in 1954. Gross income (cash receipts from sales plus value of turkeys consumed on farms where produced) totalled \$4,844,000 in 1955 compared with \$5,112,000 in 1954, a decrease of 5 percent. Turkeys on farms January 1, 1956 numbered only 20,000, a decrease of 50 percent from the 40,000 on January 1, 1955 and was the smallest number of record dating back to 1929. Turkey breeder hens on hand January 1, 1956 at 8,000 was also the smallest beginning year inventory on record.

¹ Compiled from reports of the Colorado Tax Commission.² Includes animals "grazed" in transit, but excludes animals "fed" in transit. Animals "grazed" in transit are primarily breeding stock, while animals "fed" in transit are primarily those being fattened for slaughter.³ Number assessed as "fed in transit" are not included.

LAND CLASSIFICATION OF COLORADO

- Irrigated land
- First class dry farming
- Second class dry farming
- Third class dry farming
- Sand hills
- National forests
- National parks
- Grain crop land
- Grazing land
- Forage crop land

WHY CROP AND LIVESTOCK REPORTS

A man's judgment is no better than his facts and crop reports are the basic facts of Agriculture.

They aid farmers in planning their production and marketing.

They are essential in enacting wise legislation affecting Agriculture.

They are the basis for analysis of agricultural and other business conditions.

They enable railroads to make a better distribution of cars for moving farm products.

They give producers the same foresight to future price trends that organized dealers possess.

They are a check on fluctuation in price. Uncertainty of supply promotes undue fluctuation in price.

They are indispensable in times of war because food is as essential as ammunition and weapons of war.

They are the best basis for adjusting supply to demand which is highly essential if maximum price is to prevail.

They aid farm organizations, schools and others in planning constructive programs, and the prospective purchaser of land.

They give information on surplus and deficit areas of production making possible a more economical distribution of products.

They eliminate the ill effects of misleading reports that might be circulated for private gain, if there were no official reports.

They are a guide to farm resources and for developing new resources such as irrigation, electric power, location of food processing and other factories.

They reduce the amount of speculation in farm products. Speculation thrives on uncertainty. Unbiased official crop reports reduce uncertainty which limits speculation.

They indicate potential buying power thereby enabling the manufacturer to meet the probable demand. With economical production and distribution, the manufacturer can sell at a lower price than he could with uncertain demand.

They reduce the risk of ownership of buyers of farm products which enables them to do business on a smaller margin. Under the stimulus of competition, they pay producers higher prices than could be paid if uncertainty of production existed.

They provide an accurate, unbiased picture of Colorado's agriculture. The facts on present and prospective supplies furnish a sound basis for judgment and action by farmers, other individuals, business men, railroads, crop and livestock interests and governmental agencies.
